

The No Smoking armchair innovates tradition: the lightness and eco-sustainability of papier-mâché combined with a traditionally plastic shape.

Foot: Ash wood - Support ring Baked painted steel.

Shell: PAPER-BASED MATERIAL comprising exclusively non-toxic, biodegradable and renewable components. All compounds are stable and immobile. The material has fireproof properties and does not release any hazardous substances during use.

At the end of its use, it can be introduced into the environment where it degrades and provides valuable nutrients to soil and plants.

No Smoking The Future only sources paper waste from Cradle to Cradle certified printers, which can then be used by the biosphere or technosphere.

No trees are cut down specifically for the production of NoSmokingTheFuture furniture. This means that all the trees that would have been needed to produce conventional furniture are still alive, continuing to bind CO2 in the wood and soil. As a result, the material and the resulting products are positive for the climate.

Natural additives such as glue, dyes, moth repellent and flame retardant are added to the paper.

END OF USE:

As the chair shell will provide valuable nutrients to the biosphere, it should not be introduced into the classic waste system. Ideally, it should be shredded and used in gardens or agricultural areas as fertiliser and humus.

OR:

Return your old shell to us and keep the foot frame! You can buy a new shell from us in the finish and colour of your choice and you will have a like-new chair and the restyling of your furniture at the lowest economic and environmental cost. We will take care of the proper recycling of the nutrients present.
