MODULAR, ADAPTABLE AND MOBILE LIVING SOLUTIONS

Building on the Housing First strategy, architect Astrid Lykke has designed permanent, sustainable modular housing made of cross-laminated timber and stone with wooden interior walls that is easy, fast and cheap to assemble. The project includes private gardens and some shared spaces, to foster a sense of community. Also, residents will be able to decorate their homes, even extend them, which will avoid rows of identical houses. This concept is based on the idea that residents will take care of an environment that they are happy to live in, which, combined with the use of solid materials that age well, should reduce the wear and tear homeless housing is often exposed to. People living on the streets have more problems than just being homeless. An alternative form of housing, prioritizing aesthetics, quality and inclusion with a balance between privacy and community, offers a higher chance to find one's way back into society.
